[Code]	[Credits]	[Program]	[Semester]	[Hours]	[Language of instruction]
GTE503	2	Electrical and Electronic Engineering	2nd Semester	Thu.／I	

[Outline and purpose]

This course provides the knowledge to understand the principle of semiconductor devices as key devices for highly information-oriented society in recent years.

[Objectives]

1. To understand the fundamental physics of organic semiconductor-based electronic devices compared with inorganic counterparts
2. To understand the fundamental physics of semiconductor power devices and their application

[Requirements]

Basic knowledge of Electromagnetism and Semiconductor Engineering

[Evaluation]

Test / Report 100%

[Textbooks]

Original text will be used.

[References]

Appropriate references will be introduced during the course.

[Schedule]

(1) Overview of organic electronics
(2) Fundamental physics of organic semiconductors
(3) Carrier-transport mechanism in organic semiconductors
(4) Device physics of organic transistors
(5) Fabrication process of organic transistors
(6) Applications of organic transistors
(7) Introduction of organic semiconductor-based optoelectronic devices
(8) Trend of power device development
(9) Structure and physics of pin diode
(10) Structure and physics of power MOSFET
(11) Structure and physics of IGBT
(12) Structure and physics of superjunction power device
(13) Wide bandgap power devices : SiC power devices
(14) Wide bandgap power devices : GaN power devices
(15) Final examination

GTE505	2	Electrical and Electronic Engineering Embedded and Integrated System Development	1st Semester	Tue.／II	Japanese / English

[Outline and purpose]

Digital Signal Processing (DSP) techniques are widely applied in modern information and communication systems. This class covers wide range of DSP techniques from fundamentals to applications, including fundamentals on signals and systems analysis, Discrete Fourier Transform or Fast Fourier Transform, digital filter design techniques, adaptive signal processing, multi-dimensional signal processing, and state of the art DSP techniques used in digital coherent fiber-optic communication systems such as phase estimation, constant modulus algorithm and digital back propagation techniques and so on.

[Objectives]

1. to understand the purpose of signal processing
2. to analysis signals and systems using the Fourier transform, the Laplace transform and the z-transform
3. to design basic filters
4. to explain the purpose and the characteristics of advanced signal processing techniques

[Requirements]

Fundamental knowledge of mathematics such as calculus, linear algebra and complex number. Usage of MATLAB

[Evaluation]

1. midterm examination or report: 50%
2. final examination or report: 50%

[Textbooks]

1. J. H. McClellan, R. W. Schafer, and M. A. Yoder, DSP First Second Edition, Prentice Hall, 2015.
2. Sayed, Ali H., Adaptive Filters, Wiley, 2008.
3. M. Nakazawa, K. Kikuchi, T. Miyazaki, High Spectral Density Optical Communication Technologies, Springer, 2010.

[References]

Additional reading assignments would be given arbitrarily.

[Schedule]

1. Signals and systems
2. Fourier transform and frequency domain analysis
3. Fundamentals on digital filters
4. Digital filter design
5. Statistical signal processing and optimal filters
6. Adaptive signal processing
7. Arrayed signal processing
8. Multi-dimensional filters and nonlinear filters

(The above eight classes would be given by Prof./Dr. Makoto Ohki)

9. Shannon's channel capacity and brief overview of fiber-optic communication systems
10. Lasers and optical fibers
11. External optical modulators including intensity modulators, phase modulators, and quadrature modulators
12. Optical amplifiers and wavelength division multiplexing techniques
13. Multi-level modulation formats and phase diversity receivers
14. Linear and non-linear distortions under transmission in optical fibers
15. Impairments compensation techniques

(The above seven classes would be given by Prof./Dr. Masanori Hanawa)

[Outline and purpose]

Very Large Scaled Integrated circuits（VLSI）are widely used in modern electronics systems to achieve their sophistication, miniaturization and high reliability. The goal of this class is to learn how to design the latest and practical mixed signal integrated circuits. This class covers wide range of VLSI circuit design technique from fundamentals to applications, including fundamentals on MOS Transistor and its analysis, Operational amplifiers, Filters, Data convertors, Phase lock loop and so on. Furthermore, the trend of circuit design technique using discrete devices including switching DC-DC convertor design is also lectured.

[Objectives]

1. to explain characteristics and usage of MOSFETs.
2. to design a basic analog integrated circuits used in analog integrated circuits.
3. to explain and design an operational amplifier, a filter, ADC and PLL.
4. to analyse a DC-DC convertor.

[Requirements]

Basic knowledge of electric circuit, electronic circuit and circuit theory

[Evaluation]

final examination or report: 100%

[Textbooks]

Printed materials about lecture topics will be distributed during the lecture.

[References]

[Schedule]

1. Basis theorem of electronical circuits
2. MOSFET
3. Single stage amplifier
4. Operational amplifiers 1 (General considerations, Performance parameters)
5. Operational amplifiers 2 (Two stage operational amplifiers, Slew rate, Noise)
6. Filters 1 (Performance parameters, Design of transfer function)
7. Filters 2 (Active filter, Switched capacitor filter)
8. Digital to analog convertors
9. Analog to digital convertors
10. Oscillators and PLL
11. Simulator and Layout design
12. Power supply circuits 1 (Invertor, DC-DC convertor)
13. Power supply circuits 2(Analysis of a DC-DC convertor)

[Outline and purpose]

Sensing and measurement are indispensable to the advancement of science and technology as if the human sensory system to our daily life. The measurement technologies have multiple impacts on the development of basic sciences as well as on the commercial R&D. In this course, student will learn about the latest development and the fundamental principle behind the widely used scientific instruments such as electron microscope, electron spectroscope and mass spectrometer. Recent research topics on the in-situ biological analysis and imaging mass spectrometry will also be reviewed.

[Objectives]

Describe the related vacuum technologies used in the advanced measurement instrument.
Explain the principles behind the measurement and sensing technologies.
Describe the application of measurement technologies in the pursuit of basic science and commercial R&D.

[Evaluation]

Test, quiz and report (70%)
Attendance and learning attitude (30%)

[Textbooks]

Materials and lecture notes will be distributed.

[Schedule]

1. General introduction
2. Fundamentals of vacuum technology
3. Vacuum analysis and measurement
4. High voltage and gaseous breakdown
5. Electron beam technology
6. X-ray beam analytical technology
7. Optical beam technology
8. Ion beam technology
9. Scanning probe technology
10. Mass spectrometry and ionization methods
11. Isotope analysis
12. Surface and interface analysis
13. Sensors and Detectors
14. In-situ biological analysis and imaging mass spectrometry
15. Review and conclusion

[Outline and purpose]

The Great East Japan Earthquake in 2011 gave big damage to nuclear power plants and was a trigger of a big paradigm shift of an energy supply system. This course provides an introduction to energy systems and renewable energy resources with a scientific examination of the energy field. The course explores society's present needs and future energy demands and focuses on electric power generation, electric power transmission and energy conversion.

[Objectives]

Students completing the course will

1. be able to explain about history of electric energy, electric power generation, electric power transmission, power use, and energy conversion.
2. be able to explain about energy resource, fossil energy, and nuclear energy.
3. be able to explain about thermal energy and heat pump technology.
4. be able to explain about chemical energy, fuel cell, and hydrogen energy system.

[Requirements]

Requirements for admission to the course are basic knowledge of high voltage engineering, electric engineering, and physics.

[Evaluation]

Quizzes and homework assignments 35%
Final examination and presentation 65%

[Textbooks]

1. Makoto Katsurai, 基礎エネルギー工学, Suurikougakusha-sha, ISBN4901683047

[References]

1. S. T. Pai and Qi Zhang, Introduction to high power pulse technology, World Scientific, ISBN9810217145

[Schedule]

1. Work, energy, and power revolution
2. Current status and problems of primary energy, and quizzes
3. History of electric energy
4. Electricity business in Japan
5. Electric power generation, electric power transmission, and energy conversion
6. Power electronics technology and quizzes
7. Energy resource
8. Nuclear energy
9. Nuclear fusion and quizzes
10. Thermal dynamics
11. Thermal dynamics in thermal power generation and nuclear power generation
12. Heat pump technology and quizzes
13. Chemical energy and battery
14. Hydrogen energy and fuel cell
15. Final examination and presentation

GTE509	2	Electrical and Electronic Engineering	1st Semester	Tue.／III	Japanese

[Outline and purpose]

Semiconductor power device is a key technology supporting today's our life from home-electronics to cars, trains and industries. Researchers and engineers in the forefront of major power-device industry give lectures on physics and technology of power semiconductor devices emphasizing packaging technology. You will learn up-to-date state of power devices from R&D phase to industrial product phase.

[Objectives]

By the end of the course, you will be able to understand and describe basic power-device characteristics, thermal and structural design and insulation technique of power modules, and reliability of power modules. Also you will be able to understand and describe many kinds of power-electronics equipment in today's world.

[Requirements]

It is desirable that you have bases of Semiconductor devices, Electrical circuit, Electronic circuit and Electro magnetism.

[Evaluation]

1. Final Exam：35%, 2. Midterm Exam：15%, 3. Small Quizzes /Reports：10%
4. Attendance/Behavior in Class：20% 5. Presentation：20%

[Textbooks]

[References]

[Schedule]

1. Basic physics of power semiconductor modules
2. Thermal and structural design of power semiconductor modules
3. Insulation technique of power semiconductor modules
4. Tour of Matsumoto Factory and Omachi Factory of Fuji Electric Co.
5. Materials and reliability of power semiconductor modules
6. Power Electronics -how to use power devices-
7. The latest trend of power transforming equipment (Electric car, inverter, UPS)
8. Tour of Tokyo Factory of Fuji Electric Co.
9. Application of power transforming equipment (Shinkansen train etc.)
10. Future of power semiconductors and power electronics
11. Tour of Yamanashi Factory of Fuji Electric Co.
